

# High Street Glider-Rocker

## Instructions to Release Shipping Clamps

To ensure the safe of this unit during transit, The glider-rocker mechanism is locked in place at the factory. There are two (2) thumbscrews which must be removed to allow the glider-rocker mechanism to operate.

To unlock, carefully place the unit on its side on a smooth, clean, padded work surface. Turn the two (2) knobs counter-clockwise until the glider-rocker mechanism is free to move.

The unit may now be returned to its upright position and placed in the desired location. Be very careful not to place fingers inside the framework to avoid being pinched when the glider-rocker mechanism is released.

You should allow a clearance of at least six inches (6") from the wall to avoid bumping the wall with the glider-rocker action. There are four (4) adjustable leveling glides on the bottom of the chair to ensure that the unit is level and operates properly.
